(54) Title: INFORMATION STORAGE MEDIUM

(57) Abstract: An information storage medium having a plurality of information storage layers, each of which includes an optimal power control (OPC) area for obtaining an optimal recording condition. Optimal power control areas in odd-numbered and even-numbered information storage layers viewed from a direction in which light is incident upon the information storage medium are disposed one on another to not directly

face each other. An actually usable area of an optimal power control area in each of the information storage layers varies depending on use circumstances of each of the information storage layers. Therefore, when an OPC area of one information storage layer performs OPC, this OPC does not affect another information storage layer. Also, an area of each of the information storage layers can be efficiently used.

WO 2005/001824 A1

Description

INFORMATION STORAGE MEDIUM

Technical Field

- [1] The present invention relates to recordable information storage media, and more particularly, to an information storage medium having a plurality of information storage layers, by which an area of the information storage layers can be efficiently used while minimizing an influence of an optimal power control (OPC) process executed in an OPC area, included in each of information storage layers, upon other information storage layers.

Background Art

- [2] General information storage media are widely used as information recording media of optical pickup apparatuses for recording/reproducing data in a non-contact way. Optical disks are used as the information storage medium and classified as compact disks (CDs) or digital versatile disks (DVDs) according to their information storage capacity. Examples of recordable, erasable, and reproducible optical disks are 650MB CD-R, CD-RW, 4.7GB DVD+RW, and the like. Furthermore, high definition-DVD (HD-DVD) having a recording capacity of 25GB or greater are under development.
- [3] As described above, information storage media have been developed to have a greater recording capacity. The recording capacity of an information storage medium can be increased in two representative ways of: 1) reducing the wavelength of a recording beam emitted from a light source; and 2) increasing the numerical aperture of an objective lens. In addition, there is a way of forming a plurality of information storage layers.
- [4] FIGS. 1A and 1B schematically illustrate a dual-layered information storage medium having first and second information storage layers L0 and L1. The first and second information storage layers L0 and L1 include first and second optimal power control (OPC) areas 111 and 121, respectively, for obtaining optimal writing power and first and second defect management area (DMAs) 115 and 125, respectively. The first and second OPC areas 111 and 121 face each other (i.e., the OPC areas are at a common radius relative to an inner or outer boundary of the information storage medium):
- [5] Data is recorded in the first and second OPC areas 111 and 121 using various levels of writing power to find the optimum writing power. Hence, data may be recorded with a higher level of power than the optimum writing power. Table 1 shows

variations in the jitter characteristics of each of the first and second information storage layers L0 and L1 when data is recorded in the OPC areas 111 and 121 with different levels of writing power.

[6] Table 1

[7]

	Normal writing power	Normal writing power	Normal writing power	Writing power about 20% higher than normal writing power	Writing power about 20% higher than normal writing power	Writing power about 20% higher than normal writing power
L0	Writing	Unwritten	Writing	Written	Writing	Written
L1	Unwritten	Writing	Written	Writing	Written	Writing
Jitter	5.9% (L0)	- (L0)	6.0% (L0)	5.8% (L0)	- (L0)	5.9%→6.4% (L0)
Jitter	- (L1)	6.3% (L1)	6.2% (L1)	6.3% (L1)	6.2% → 6.3% (L1)	- (L1)
Writing Power	6.4 (L0)	- (L0)	6.3 (L0)	6.3 (L0)	7.5 (L0)	6.4 (L0)
Writing Power	- (L1)	6.0 (L1)	6.0 (L1)	6.2 (L1)	6.0 (L1)	7.2 (L1)

[8] According to Table 1, if data is recorded with normal writing power, the jitter characteristics of the first or second information storage layer L0 or L1 keep constant. On the other hand, if data is recorded with writing power about 20% higher than the normal writing power, the jitter characteristics of the OPC area of the first or second information storage layer L0 or L1 in which data has already been recorded are degraded. If data is recorded on one of the first and second information storage layers L0 and L1 with writing power more than 20% higher than the normal writing power, it can be expected that the jitter characteristics of the other information storage layer may be further degraded.

[9] Hence, if the first and second OPC areas 111 and 121 of the first and second in-

formation storage layers L0 and L1 exist within an equal radius as shown in FIGS. 1A and 1B, one of them may not be usable.

- [10] The recording status of one of the first and second OPC areas 111 and 121 may affect the recording characteristics of the other OPC area. For example, as shown in FIG. 1B, if data has been recorded on a part 111a of the first OPC area 111 and no data has been recorded on the residual area 111b thereof, the recording property of a part of the second OPC area 121 which corresponds to the occupied part 111a of the first OPC area 111 is different from that of a part of the second OPC area 121 which corresponds to the unoccupied part 111b of the first OPC area 111. In other words, since the transmittance of a laser with respect to the occupied part 111a of the first OPC area 111 is different from the transmittance of a laser with respect to the unoccupied part 111b thereof, the recording property of the second OPC area 121 may be irregular over the area.

- [11] As described above, if the first and second OPC areas are disposed within an equal radius, they may not properly function.

Disclosure of Invention

Technical Problem

- [12] The present invention provides an information storage medium having a plurality of information storage layers, by which an area of the information storage layers can be efficiently used while minimizing an influence of optimal power control (OPC) executed in an OPC area included in each of information storage layers upon other information storage layers, a method of minimizing interference between OPC areas of the information storage medium and a recording and/or reproducing apparatus for minimizing interference between OPC areas of the information storage medium.

Technical Solution

- [13] According to an aspect of the present invention, there is provided an information storage medium having a plurality of information storage layers, each of which includes an optimal power control area for obtaining an optimal recording condition, wherein the optimal power control areas in odd-numbered and even-numbered information storage layers are disposed within different radiuses of the information storage medium and the size of an actually usable area of an optimal power control area in each of the information storage layers varies depending on use circumstances of each of the information storage layers.

- [14] According to another aspect of the present invention, there is provided an information storage medium having a plurality of information storage layers, each of

which includes an optimal power control area for obtaining an optimal recording condition, wherein the optimal power control areas in odd-numbered and even-numbered information storage layers are disposed within different radiuses of the information storage medium and one of the odd-numbered and even-numbered information storage layers includes a usable area for a predetermined purpose that faces the optimal power control area of the other information storage layer.

[15] According to another aspect of the present invention, there is provided a method of minimizing interference between a first optimal power control area in a first information storage layer and a second optimal power control area in a second information storage layer of an information storage medium, comprising: disposing the first and second optimal power control areas such that each is aligned with a special area of the other information storage layer that is recorded in an opposite direction to minimize interference.

[16] According to another aspect of the present invention, there is provided a recording and/or reproducing apparatus, comprising: an optical pickup which records data on and/or reads the data from a surface of an information storage medium at an optical power; and a controller which controls the optical pickup to record and/or reproduce the data on the surface of the information storage medium and to determine an optimum recording power at which to set the optical power during recording, wherein the information storage medium comprises a first information storage layer comprising a first optimal power control area and a first restricted use area, and a second information storage layer comprising a second optimal power control area and a second restricted use area disposed such that the first optimal power control area is aligned with the second restricted use area and the second optimal power control area is aligned with the first restricted use area, and the controller determines the optimal recording power according to the data recorded and/or reproduced by the optical pickup in one of the first and second optimal power control areas.

[17] In the apparatus, the first and second restricted use areas are reserved areas which are recordable by the controller in a direction opposite to the first and second optimal power control areas.

[18] In the apparatus, the first restricted area is a reserved area which is recordable by the controller in a direction opposite to the first and second optimal power control areas and the second restricted area is a usable area which is recordable in any direction with respect to the first and second optimal power control areas.

[19] Additional aspects and/or advantages of the invention will be set forth in part in the

description which follows and, in part, will be obvious from the description, or may be learned by practice of the invention.

Description of Drawings

[20] The above and/or other aspects and advantages of the present invention will become more apparent by describing in detail exemplary embodiments thereof with reference to the attached drawings of which:

[21] FIGS. 1A and 1B are views illustrating an influence of an optimal power control (OPC) area upon an area other than the OPC area in a conventional dual-layered information storage medium;

[22] FIG. 2 illustrates a layout of a data area of a dual-layered information storage medium according to an embodiment of the present invention;

[23] FIGS. 3A and 3B illustrate a layout of a data area of a dual-layered information storage medium according to another embodiment of the present invention;

[24] FIGS. 4A and 4B illustrate a layout of a data area of a dual-layered information storage medium according to another embodiment of the present invention;

[25] FIGS. 5A through 5D illustrate a layout of a data area of a dual-layered information storage medium according to another embodiment of the present invention;

[26] FIG. 6 illustrates a layout of a data area of a dual-layered information storage medium according to an embodiment of the present invention;

[27] FIG. 7 illustrates a layout of a data area of a dual-layered information storage medium according to another embodiment of the present invention;

[28] FIG. 8 is a block diagram of an apparatus for recording/reproducing information to/from an information storage medium according to an embodiment of the present invention; and

[29] FIG. 9 is a more detailed block diagram of the recording and/or reproducing apparatus of FIG. 8 .

Mode for Invention

[30] Reference will now be made in detail to the embodiments of the present invention, examples of which are illustrated in the accompanying drawings, wherein like reference numerals refer to the like elements throughout. The embodiments are described below to explain the present invention by referring to the figures.

[31] Referring to FIG. 2, an information storage medium according to an embodiment of the present invention includes at least two information storage layers L0 and L1. Each of the information storage layers L0, L1 includes an optimal power control (OPC) area 211, 223 for obtaining optimal power and a reserved area 213, 221. The

OPC areas 211, 223 of the information storage layers L0, L1 are disposed within different radii such as not to face each other. Although not shown, each of the information storage layers may include a map area adjacent to the OPC area 211, 223.

[32] The information storage medium shown in FIG. 2 includes first and second information storage layers L0 and L1. The first information storage layer L0 includes a first OPC area 211, a first reserved area 213, and a first disk information (DI) area 215. The second information storage layer L1 includes a second reserved area 221, a second OPC area 223, and a second DI area 225. The first and second DI areas 215 and 225 store data that is updated upon every data recording, such as, an address of a used part of an OPC area, information about a status of an information storage layer, and the like. Examples of the information about a status of an information storage layer include a recording mode, and an address recorded last according to a recording mode.

[33] The first and second OPC areas 211 and 223 in the information storage layers L0 and L1 are disposed within different radii of the information storage medium such that the first and second OPC areas 211 and 223 do not face each other. More specifically, the second reserved area 221 is disposed in an area of the second information storage layer L1 opposite to the first OPC area 211 of the first information storage layer L0, and the first reserved area 213 is disposed in an area of the first information storage layer L0 opposite to the second OPC area 223 of the second information storage layer L1.

[34] The first and second DI areas 215 and 225 of the first and second information storage layers L0 and L1, respectively, are disposed within an identical radius of the information storage medium. Defect management areas (DMAs) may be used instead of or in addition to the DI areas 215 and 225.

[35] FIGS. 3A and 3B illustrate an information storage medium according to another embodiment of the present invention, in which the first information storage layer L0 includes a first OPC area 311, a first reserved area 313, and a first defect management area (DMA) 315, and the second information storage layer L1 includes a second reserved area 321, a second OPC area 323, and a second DMA 325.

[36] Referring to FIGS. 3A and 3B, directions of data recording in each OPC area 311, 323 and a reserved area 313, 321 of each information storage layer L0, L1, (i.e., directions of the use of the OPC area 311, 323 and the reserved area 313, 321) are identical. In other words, while data is recorded in an OPC area 311, 323 and a reserved area 313, 321 of each information storage layer L0, L1 in an identical direction, data is recorded in facing areas of different information storage layers L0,

L1 in opposite directions. That is, the facing areas of different information storage layers L0, L1 are used in opposite directions so that they are not used together upon data recording.

[37] In FIG. 3A, regardless of a track spiral direction of the information storage medium, data is recorded in the first OPC area 311 and the first reserved area 313 of the first information storage layer L0 in an identical direction from an inner boundary to an outer boundary of the information storage medium. In other words, the first OPC area 311 and the first reserved area 313 are used in the identical direction from the inner boundary to the outer boundary of the information storage medium. Data is recorded in the second reserved area 321 and the second OPC area 323 of the second information storage layer L1 in an identical direction from the outer boundary to the inner boundary of the information storage medium. In other words, the second reserved area 321 and the second OPC area 323 are used in the identical direction from the outer boundary to the inner boundary of the information storage medium. Thus, the facing OPC and reserved areas of the first and second storage layers L0 and L1 are used in opposite directions.

[38] In FIG. 3B, regardless of the track spiral direction of the information storage medium, data is recorded in the first OPC area 311 and the first reserved area 313 of the first information storage layer L0 in the identical direction from the outer boundary to the inner boundary of the information storage medium. In other words, the first OPC area 311 and the first reserved area 313 are used in the identical direction from the outer boundary to the inner boundary of the information storage medium. Data is recorded in the second reserved area 321 and the second OPC area 323 of the second information storage layer L1 in the identical direction from the inner boundary to the outer boundary of the information storage medium. In other words, the second reserved area 321 and the second OPC area 323 are used in the identical direction from the inner boundary to the outer boundary of the information storage medium, but opposite the direction of use of the first OPC area 311 and the first reserved area 313.

[39] FIGS. 4A and 4B illustrate an information storage medium according to another embodiment of the present invention, in which the first information storage layer L0 includes a first OPC area 411, a first reserved area 413, and a first DMA 415, and the second information storage layer L1 includes a second reserved area 421, a second OPC area 423, and a second DMA 425.

[40] Referring to FIGS. 4A and 4B, directions of data recording in an OPC area 411, 423 and a reserved area 413, 421 of each information storage layer L0, L1 (i.e.,

directions of the use of the OPC area 411, 423 and the reserved area 413, 421) are opposite. In other words, while data is recorded in an OPC area 411, 423 and a reserved area 413, 421 of each information storage layer L0, L1 in opposite directions, data is recorded in facing areas of different information storage layers in opposite directions. That is, the facing areas of different information storage layers are used in opposite directions so that they are not used together upon data recording.

[41] In FIG. 4A, regardless of the track spiral direction of the information storage medium of FIG. 2, directions of data recording in a first OPC area 411 and a first reserved area 413 of a first information storage layer L0 are opposite. That is, directions of the use of the first OPC area 411 and the first reserved area 413, are from an inner boundary to an outer boundary of the information storage medium and from the outer boundary to the inner boundary, respectively. Directions of data recording in a second reserved area 421 and a second OPC area 423 of a second information storage layer L1, that is, directions of the use of the second reserved area 421 and the second OPC area 423, are from the outer boundary to the inner boundary of the information storage medium and from the inner boundary to the outer boundary, respectively.

[42] In FIG. 4B, regardless of the track spiral direction of the information storage medium, directions of data recording in the first OPC area 411 and the first reserved area 413 of the first information storage layer L0, (i.e., directions of the use of the first OPC area 411 and the first reserved area 413) are from the outer boundary to the inner boundary of the information storage medium and from the inner boundary to the outer boundary, respectively. Directions of data recording in the second reserved area 421 and the second OPC area 423 of the second information storage layer L1, (i.e., directions of the use of the second reserved area 421 and the second OPC area 423) are from the inner boundary to the outer boundary of the information storage medium and from the outer boundary to the inner boundary, respectively.

[43] In FIGS. 3A and 3B or FIGS. 4A and 4B, it is understood that the order of the OPC area and the reserved area arranged in each of the first and second information storage layers L0 and L1 may be inverted according to different aspects.

[44] In the information storage media of FIGS. 3A and 3B and FIGS. 4A and 4B, addresses of used parts of the first OPC areas 311 and 411 and the second OPC areas 323 and 423 are recorded in the first reserved areas 313 and 413 and the second reserved areas 321 and 421, respectively. Hence, the size of an actually usable area of an OPC area of an information storage layer varies by a used area of a reserved area of

an adjacent information storage layer depending on the environments of the use of each information storage layer, for example, depending on a type of data recorded in each information storage layer or a frequency of the use of each information storage layer.

- [45] FIGS. 5A through 5D illustrate an information storage medium according to another embodiment of the present invention, which includes map areas 512, 522 for storing addresses of used parts of the OPC areas 511, 523 in information storage layers L0 and L1 are disposed adjacent to the OPC areas 511, 523. In contrast with FIGS. 3A and 3B and FIGS. 4A and 4B, a reserved area allocated in each of the information storage layers L0 and L1 is used for a purpose other than the storage of the addresses of used parts of the OPC areas 511, 523. When such a map area is disposed adjacent to an OPC area 511, 523 in each information storage layer as described above, a usable part of the OPC area 511, 523 can be rapidly identified before the OPC is performed in each information storage layer L0, L1. Thus, a time required to perform the OPC can be shortened.
- [46] The addresses of the OPC areas 511, 523 may be recorded in the map area in various forms, for example, in the form of a bitmap. The map area 512, 522 may be replaced by a disk information (DI) area which can store not only OPC information but also information updated upon every data recording, for example, an address finally recorded in a user area or the like.
- [47] In FIGS. 5A through 5D, the first information storage layer L0 includes a first OPC area 511, a first map area 512, a first reserved area 513, and a first DMA 515, and the second information storage layer L1 includes a second reserved area 521, a second map area 522, a second OPC area 523, and a second DMA 525. The first and second map areas 512 and 522 are disposed within an identical radius of the information storage medium, and the first and second DMAs 515 and 525 are similarly situated on a different radius of the information storage medium.
- [48] Generally, the information storage media illustrated in FIGS. 5A and 5B are formed by further allocating the first and second map areas 512 and 522 in the information storage media of FIGS. 3A and 3B. The information storage media illustrated in FIGS. 5C and 5D are formed by further allocating the first and second map areas 512 and 522 in the information storage media of FIGS. 4A and 4B. As described above, the reserved areas 513, 521 illustrated in FIGS. 5A through 5D are not used to store data updated upon every data recording, such as, the addresses of used parts of the OPC areas 511, 523.

- [49] FIG. 6 illustrates an information storage medium according to another embodiment of the present invention. Considering the fact that characteristics of data recording in inner and outer boundaries of an information storage medium may be different, OPC areas 611, 631, 617, 637 are disposed in at least one of a lead-in area 610 and a lead-out area 630 which are disposed on opposite sides of a data area 620, respectively. In the first and second information storage layers L0 and L1, first and second OPC areas 611 and 617 of the lead-in area 610 and first and second OPC areas 631 and 637 of the lead-out area 630 may be disposed on both sides of third and fourth data areas 621 and 623 the data area 620 using one of the arrangements illustrated in FIGS. 2 through 5.
- [50] FIG. 7 illustrates an information storage medium according to another embodiment of the present invention. Considering the fact that degrees of influence of the OPCs executed in the first and second information storage layers L0 and L1 upon jitter characteristics of the first and second information storage layers L0 and L1, respectively, are different, a reserved area 713 is allocated in one of the first and second information storage layers L0 and L1, and a usable area 721 is allocated in the other information storage layer.
- [51] Referring to Table 1, the OPC in the second information storage layer L1 affects jitter characteristics more than the OPC in the first information storage layer L0. Of course, if the thickness of a space layer interposed between the first and second information storage layers L0 and L1 is changed or a structure of each information storage layer is changed, a phenomenon opposite to the above influencing phenomenon may occur. That is, the OPC in the first information storage layer L0 affects jitter characteristics more than the OPC in the second information storage layer L1. In the information storage medium of FIG. 7, the OPC in the second information storage layer L1 affects jitter characteristics more than the OPC in the first information storage layer L0.
- [52] In the information storage medium of FIG. 7, the first information storage layer L0 includes a first OPC area 711, a first reserved area 713, and a first DI area 715, and the second information storage layer L1 includes a usable area 721, a second OPC area 723, and a second DI area 725. The usable area 721 of the second information storage layer L1 faces the first OPC area 711 of the first information storage layer L0, which affects jitter characteristics less than the second OPC area 723 of the second information storage layer L1, and can be used to store data used for a special purpose, such as a purpose set by a user or a manufacturer. The first and second DI areas 715 and 725 are disposed within an identical radius of the information storage medium and

store OPC information or information updated upon every data recording, such as, an address finally recorded in a user area or the like. The DI areas 715 and 725 may be replaced by map areas that are disposed within an identical radius of the information storage medium and that store information about the first and second OPC areas 711 and 723.

[53] Areas arranged as illustrated in FIG. 7 can be disposed in both a lead-in area and a lead-out area or in one of a lead-in area and a lead-out area.

[54] FIG. 8 is a block diagram of an optical recording and/or reproducing apparatus according to an embodiment of the present invention in which the information storage media of FIGS. 2-7 are implemented. Referring to FIG. 8, the recording and/or reproducing apparatus includes a writing/reading unit 1000 and a control unit 1002. The writing/reading unit 1000 reads from and writes to the information storage medium 130 according to commands from the control unit 1002. Here, the information storage medium 130 includes several embodiments shown in FIGS. 2 through 7 and the control unit 1002 controls data writing/reading operations of the writing/reading unit 1000 so as to minimize interference between a first optimal power control area in a first information storage layer and a second optimal power control area in a second information storage layer of the information storage medium 130.

[55] Referring to FIG. 8, according to the control of the control unit 1002, the writing/reading unit 1000 records data on a disc 130, which is an information storage medium according to embodiments of the present invention, and reads out data in order to reproduce recorded data. The control unit 1002 controls the writing/reading unit 1000 so that the writing/reading unit 1000 records data in predetermined recording unit blocks, or processes data read by the writing/reading unit 1000 and obtains valid data. Reproducing refers to obtaining valid data by performing error correction for the read data, and is performed in predetermined units. The units for performing reproduction are referred to as reproducing unit blocks. A reproducing unit block corresponds to at least one recording unit block.

[56] FIG. 9 is a more detailed block diagram of the optical recording and/or reproducing apparatus of FIG. 8. Referring to FIG. 9, the information storage medium 130 is loaded in the writing/reading unit 1000. The recording and/or reproducing apparatus further includes an optical pickup 1100 that reads from and writes to the information storage medium 130. The control unit 1002 includes a PC I/F 1101, a DSP 1102, an RF AMP 1103, a servo 1104, and a system controller 1105, all of which constitute the control unit 1002 of FIG. 8.

- [57] In the data recording operation, the PC I/F 110 1 receives a recording command with data to be recorded from a host. The DSP 110 2 adds additional data such as a parity for error correction of the data received from the PC I/F 110 1 and performs error correction and checking (ECC) encoding to generate an ECC block, which is an error correction block, and modulates the ECC block according to a predetermined method. The RF AMP 110 3 converts the data output from the DSP 110 2 into an RF signal. The pickup 1 10 0 records the RF signal output from the RF AMP 110 3 on the disc 1 3 0. The servo 110 4 receives a command required for servo control from the system controller 110 5 and servo-controls the pickup 10 00 .
- [58] In the data reproducing operation, the PC I/F 110 1 receives a reproduction command from a host (not shown). The system controller 110 5 performs the initialization required for reproduction. The pickup 1 00 0 emits a laser beam onto the disc 1 3 0, obtains an optical signal by receiving a reflected beam from the disc 1 3 0, and outputs the optical signal. The RF AMP 110 3 converts the optical signal output from the pickup 1 00 0 into an RF signal and provides modulated data obtained from the RF signal to the DSP 110 2 while providing a servo signal for control of the pickup obtained from the RF signal to the servo 110 4. The DSP 110 2 demodulates the modulated data, performs error correction and outputs the resulting data.
- [59] Meanwhile, the servo 110 4 performs servo control of the pickup 1 00 0, by using the servo signal received from the RF AMP 110 3 and a command required for servo control received from the system controller 110 5. The PC I/F 21 transfers the data received from the DSP 110 2 to the host.
- [60] The aforementioned OPC area arrangement embodiments are applicable to all information storage media regardless of whether a track of each information storage layer is spiraled from an inner boundary to an outer boundary or from the outer boundary to the inner boundary. The aforementioned OPC area arrangements are also applicable to all information storage media having a plurality of information storage layers regardless of whether an information storage layer to be reproduced first is either an information storage layer farthest from or closest to an optical pickup. For example, the aspects of the present invention described above are applicable to CD-R, CD-RW, DVD+RW, HD-DVD, Bluray, and Advanced Optical Disc (AOD) type information storage media. Although the OPC area arrangements have been described with regard to a dual-layered information storage medium having two information storage layers, they may be applied to information storage media having at least three information storage layers which are stacked one on another.

- [61] As described above, in an aspect of an information storage medium having a plurality of information storage layers, an OPC area of one information storage layer may be located to not directly face the OPC area of another information storage layer. Information about an OPC area (that is, OPC information) in one information storage layer is recorded in a reserved area of an adjacent information storage layer that faces the OPC area, and the directions of data recording in an OPC area of one information storage layer and a reserved area of another information storage layer that faces the OPC area are set to be opposite. That is, directions of the use of the OPC area and the reserved area are set to be opposite. Therefore, an influence of the OPC executed in an OPC area of one information storage layer upon another information storage layer is minimized, and the size of an actually usable area of the OPC area of each information storage layer varies depending on the use circumstances of the OPC area.
- [62] Alternatively, the OPC area of one information storage layer may be located to not directly face the OPC area of another information storage layer each other, and a map area for storing OPC information is included between the OPC area and a reserved area of each information storage layer according to an aspect of the invention. Therefore, when the OPC area of one information storage layer performs the OPC, this OPC does not affect another information storage layer. Also, an area of each information storage layer can be efficiently used, and a time required to perform the OPC can be shortened.
- [63] Alternatively, the OPC area of one information storage layer may be located with respect to an OPC area of another information storage layer such that the OPC areas do not face each other, and, considering the fact that degrees of influence of the OPC areas of two adjacent information storage layers upon jitter characteristics are different, a reserved area is allocated in only one of the two information storage layers, and a usable area is allocated in the other information storage layer according to an aspect of the invention. Therefore, when the OPC area of one information storage layer performs the OPC, this OPC does not affect another information storage layer, and an area of each information storage layer can be efficiently used.
- [64] Although a few embodiments of the present invention have been shown and described, it would be appreciated by those skilled in the art that changes may be made in these embodiments without departing from the principles and spirit of the invention, the scope of which is defined in the claims and their equivalents.

Claims

- [1] An information storage medium, comprising:
a plurality of information storage layers, each of which includes an optimal power control area for obtaining an optimal recording condition, wherein the optimal power control areas in odd-numbered and even-numbered information storage layers are disposed within different radiuses of the information storage medium and a size of an actually usable area of an optimal power control area in each of the information storage layers varies depending on use circumstances of each of the information storage layers.
- [2] The information storage medium of claim 1, further comprising:
a reserved area in each of the information storage layers, wherein each of the reserved areas face the optimal power control area of an adjacent information storage layer.
- [3] The information storage medium of claim 2, further comprising:
a map area storing updated information about each of the information storage layers; and
the map areas are disposed within an identical radius of the information storage medium.
- [4] The information storage medium of claim 2, wherein updated information about each of the information storage layers is recorded in the reserved area.
- [5] The information storage medium of claim 2, wherein updated information about each of the information storage layers is recorded in a part of a lead-in area that stores disk-related information.
- [6] The information storage medium of claim 2, wherein a direction in which data is recorded in the optimal power control area and the reserved area of the odd-numbered information storage layer is opposite to a direction in which data is recorded in the optimal power control area and the reserved area of the even-numbered information storage layer.
- [7] The information storage medium of claim 6, wherein directions in which data is recorded in the optimal power control area and the reserved area of one information storage layer are identical.
- [8] The information storage medium of claim 6, wherein directions in which data is recorded in the optimal power control area and the reserved area of one information storage layer are opposite.

- [9] The information storage medium of claim 6, wherein the optimal power control areas are formed in at least one of a lead-in area and a lead-out area.
- [10] The information storage medium of claim 3, wherein a first direction in which data is recorded in the optimal power control area, the map area and the reserved area of the odd-numbered information storage layer is opposite to a second direction in which data is recorded in the optimal power control area, the map area and the reserved area of the even-numbered information storage layer.
- [11] The information storage medium of claim 10, wherein directions in which data is recorded in an optimal power control area and a reserved area of one information storage layer are opposite.
- [12] An information storage medium, comprising:
a plurality of information storage layers, each of which includes an optimal power control area for obtaining an optimal recording condition, wherein the optimal power control areas in odd-numbered and even-numbered information storage layers are disposed within different radiuses of the information storage medium and one of the odd-numbered and even-numbered information storage layers includes a usable area for a predetermined purpose that faces the optimal power control area of the other information storage layer.
- [13] The information storage medium of claim 12, wherein the other information storage layer further comprises a reserved area which faces an optimal power control area of the one information storage layer.
- [14] The information storage medium of claim 13, wherein:
each of the information storage layers further comprises a map area storing updated information about each of the information storage layers; and
the map areas are disposed within an identical radius of the information storage medium.
- [15] The information storage medium of claim 13, further comprising updated information about each of the information storage layers which is recorded in a part of a lead-in area that stores disk-related information.
- [16] The information storage medium of claim 13, wherein a direction in which data is recorded in the optimal power control area of one of the information storage layers is opposite to a direction in which data is recorded in the reserved area of the other information storage layer.
- [17] The information storage medium of claim 16, wherein the optimal power control areas are formed in at least one of a lead-in area and a lead-out area.

- [18] A multilayer information storage medium, comprising:
a first information storage layer comprising a first optimal power control area and a first reserved area adjacent to the first optimal power control area; and
a second information storage layer adjacent to the first information storage layer, the second information storage layer comprising a second optimal power control area and a second reserved area adjacent to the second optimal power control area, wherein the first optimal power control area is aligned with the second reserved area and the second optimal power control area is aligned with the first reserved area.
- [19] The information storage medium of claim 18, wherein the first optimal power control area and the second optimal power control area are recorded in a first direction and the first reserved area and the second reserved area are recorded in a second direction opposite the first direction.
- [20] The information storage medium of claim 18, wherein the first optimal power control area and the second optimal power control area are recorded in opposite directions with respect to each other and the first reserved area and the second reserved area are recorded in opposite directions with respect to each other.
- [21] The information storage medium of claim 18, further comprising:
a first map area which stores addresses of sectors of the first optimal power control area in which data is recorded, the first map area disposed between the first optimal power control area and the first reserved area in the first information storage layer; and
a second map area which stores addresses of sectors of the second optimal power control area in which data is recorded, the second map area disposed between the second optimal power control area and the second reserved area in the second information storage layer.
- [22] The information storage medium of claim 21, wherein the addresses of the first and second optimal power control areas are recorded in the first and second map areas, respectively, in the form of a bitmap.
- [23] The information storage medium of claim 21, wherein a time required to write to and read from the first and second optimal power control areas is shortened by the stored addresses in the first and second map areas.
- [24] The information storage medium of claim 21, wherein the first optimal power control area, the second optimal power control area and the first map area are written to in a first direction and the first reserved area, the second reserved area,

and the second map area are written to in a second direction opposite the first direction.

[25] The information storage medium of claim 21, wherein the addresses are recorded in the first map area and the second map area in opposite directions with respect to each other.

[26] The information storage medium of claim 21, wherein the first optimal power control area, the first map area, and the first reserved area are written to in a first direction, and the second optimal power control area, the second map area, and the second reserved area are written to in a second direction opposite the first direction.

[27] The information storage medium of claim 21, further comprising:
a third optimal power control area in the first information storage layer, a third reserved area adjacent to the third optimal power control area, and a third map area between the third optimal power control area and the third reserved area;
and
a fourth optimal power control area, a fourth reserved area adjacent to the fourth optimal power control area, and a fourth map area between the fourth optimal power control area and the fourth reserved area, wherein the third optimal power control area is aligned with the fourth reserved area, the fourth optimal power control area is aligned with the third reserved area, and the third map area is aligned with the fourth map area.

[28] The information storage medium of claim 27, wherein the first optimal power control area, map area and reserved area are disposed near an inner boundary of the information storage medium and the third optimal power control area, map area and reserved area disposed near an outer boundary of the information storage medium.

[29] The information storage medium of claim 27, wherein the first optimal power control area, map area and reserved area are disposed in a lead-in area of the information storage medium and the third optimal power control area, map area and reserved area disposed in a lead-out area of the information storage medium.

[30] A multilayer information storage medium, comprising:
a first information storage layer comprising a first optimal power control area and a first reserved area adjacent to the first optimal power control area; and
a second information storage layer adjacent to the first information storage layer, the second information storage layer comprising a second optimal power control

area and a special use area adjacent to the second optimal power control area, the special use area storing data for a special purpose set by a manufacturer, wherein the first optimal power control area is aligned with the special use area and the second optimal power control area is aligned with the first reserved area.

[31] A method of minimizing interference between a first optimal power control area in a first information storage layer and a second optimal power control area in a second information storage layer of an information storage medium, comprising: disposing the first and second optimal power control areas such that each is aligned with a special area of the other information storage layer that is recorded in an opposite direction to minimize interference.

[32] A recording and/or reproducing apparatus, comprising:
an optical pickup which records data on and/or reads the data from a surface of an information storage medium at an optical power; and
a controller which controls the optical pickup to record and/or reproduce the data on the surface of the information storage medium and to determine an optimum recording power at which to set the optical power during recording,
wherein the information storage medium comprises a first information storage layer comprising a first optimal power control area and a first restricted use area, and a second information storage layer comprising a second optimal power control area and a second restricted use area disposed such that the first optimal power control area is aligned with the second restricted use area and the second optimal power control area is aligned with the first restricted use area, and the controller determines the optimal recording power according to the data recorded and/or reproduced by the optical pickup in one of the first and second optimal power control areas.

[33] The apparatus of claim 32, wherein the first and second restricted use areas are reserved areas which are recordable by the controller in a direction opposite to the first and second optimal power control areas.

[34] The apparatus of claim 32, wherein the first restricted area is a reserved area which is recordable by the controller in a direction opposite to the first and second optimal power control areas and the second restricted area is a usable area which is recordable in any direction with respect to the first and second optimal power control areas.
